

Artemis BiblioSelect -- Usage Walkthrough

Step-by-step guide through a full screening session, using the synthetic example dataset (examples/example-100.csv). Screenshots were captured from the running production build.

1 Getting the software -- GitHub repository

Artemis BiblioSelect is open source, hosted at <https://github.com/Magrine/artemis-biblioselect>. There are two ways to get it: download the ready-to-run portable app from the Releases page (no build tools required), or clone the source and build/run it yourself with Node.js.

The screenshot shows the GitHub repository page for **Magrine / artemis-biblioselect**. The repository is public and has 2 commits. The main branch is selected. The file list includes:

File	Commit	Time
build	Project upload	8 months ago
electron	Project upload	8 months ago
release	Authors' correction	8 months ago
src	Authors' correction	8 months ago
.gitignore	Project upload	8 months ago
README.md	Project upload	8 months ago
artemis.svg	Project upload	8 months ago
eslint.config.js	Project upload	8 months ago
index.html	Project upload	8 months ago
package-lock.json	Project upload	8 months ago
package.json	Project upload	8 months ago
vite.config.js	Project upload	8 months ago
yarn.lock	Project upload	8 months ago

The right sidebar contains the following sections:

- About**: A user-centered tool for efficient bibliometric screening and review workflows. Developed with React, Vite, and Electron.
- Readme**: Link to the README file.
- Activity**: Link to the repository activity.
- Stars**: 0 stars.
- Watching**: 0 watching.
- Forks**: 0 forks.
- Report repository**: Link to report the repository.
- Releases**: 1 release. **Artemis • BiblioSelect | v1.0.0** (Latest) on Mar 6.
- Packages**: No packages published.
- Contributors**: 1 contributor. **Magrine** Magrine Cavalcante.
- Languages**: Link to the repository languages.

2 Option A -- Download the portable app

On the Releases page, open the latest release and expand "Assets". Download `Artemis-Portable-1.0.0-x64.exe` and run it directly -- it is a portable Windows executable, so no installation step is required. This is the fastest path for reviewers or end users who just want to run the app.

The screenshot shows the GitHub interface for the repository `Magrine / artemis-biblioselect`. The top navigation bar includes links for Platform, Solutions, Resources, Open Source, Enterprise, and Pricing, along with a search bar and sign-in/sign-up buttons. The repository page header shows the repository name, a 'Public' badge, and buttons for Notifications, Fork (0), and Star (0). The main navigation tabs include Code, Issues, Pull requests, Actions, Projects, Security and quality, and Insights. The 'Releases' tab is selected, showing the release `Artemis • BiblioSelect | v1.0.0` with a 'Latest' badge. The release information indicates it was released on Mar 6 by user 'Magrine' with version `v1.0.0` and commit `acc22d`. The release description states it is the first stable release of Artemis-BiblioSelect, a software tool for bibliometric screening, document triage, and literature review workflows. It lists main features: Bibliographic dataset processing, Filtering and normalization, Visualization and selection support, and Web and desktop interfaces using React, Vite, and Electron. It also lists technologies: Node.js, React, Vite, and Electron, and provides the repository URL: <https://github.com/Magrine/artemis-biblioselect>. At the bottom, the 'Assets' section is expanded, showing a download icon and a count of 3 assets.

3 Option B -- Build and run from source

For development, contributing, or building for a different platform, clone the repository and run it with Node.js (v18 or later) and npm.

```
# 1. Clone the repository
git clone https://github.com/Magrine/artemis-biblioselect.git
cd artemis-biblioselect

# 2. Install dependencies
# Note: a peer-dependency conflict in react-wordcloud currently requires
# --legacy-peer-deps on a clean install.
npm install --legacy-peer-deps

# 3. Choose how to run it:

# 3a. Web app, development mode (hot reload) -> http://localhost:5173
npm run dev

# 3b. Desktop app, development mode (Electron + live Vite server)
npm run electron

# 3c. Production web build, then preview it locally
npm run build:web
npx vite preview

# 3d. Package a distributable desktop app (Windows portable .exe)
npm run build:win:portable
```

4 Home -- create a project

Every screening session lives inside a project, which keeps its articles and screening decisions independent from any other project. Give it a name and click “Create Project”.

ARTEMIS • BIBLIOSELECT

ARTEMIS BIBLIOSELECT

Research doesn't have to feel overwhelming

BiblioSelect simplifies article screening — import your data, tag what matters, and focus your time on analyzing results, writing, and moving your research forward.

YOUR PROJECTS

Projects help you organize your reviews into separate workspaces. Each project keeps its own articles and screening decisions, fully independent from the others.

No projects yet — create your first one below.

6 Screening workspace -- import a CSV

The screening workspace starts empty. Click "Upload CSV" (or drag a file onto the page) to import a Scopus-format export. This walkthrough uses examples/example-100.csv, a small synthetic dataset of 100 articles bundled with the repository.

A SCALABLE APPROACH TO WATER QUALITY ASSESSMENT USING CLOUD COMPUTING (CASE 63)

This study investigates water quality assessment in the context of modern agricultural production systems. We propose a methodology combining machine learning classifiers with simulation to assess feasibility and performance. Results indicate measurable improvements in resource use efficiency compared to conventional practice, with three replicate trials showing consistent trends. The findings contribute to the growing body of work on water quality assessment and provide practical guidance for practitioners and policy makers seeking to adopt similar technologies at scale.

8 Searching and filtering

Typing a term in the search box filters the list by title and abstract in real time -- useful for narrowing down a large import to a specific sub-topic before screening.

EVALUATING PRECISION IRRIGATION PERFORMANCE UNDER TEMPERATE CONDITIONS (CASE 99)

This study investigates precision irrigation in the context of modern agricultural production systems. We propose a methodology combining low-cost sensors with simulation to assess feasibility and performance. Results indicate measurable improvements in yield stability compared to conventional practice, with three replicate trials showing consistent trends. The findings contribute to the growing body of work on precision irrigation and provide practical guidance for practitioners and policy makers seeking to adopt similar technologies at scale.

12 Screening complete

Once every article has a decision (0 pending), the "Results" button in the top bar becomes enabled.

The screenshot displays the Artemis Biblioselect web application interface. At the top, a navigation bar includes the logo, the text 'ARTEMIS • BIBLIOSELECT', and four buttons: 'Back', 'Reset', 'Delete Project', and 'Results'. Below the navigation bar, a progress indicator shows '100% reviewed'. The main content area is divided into three panels. The left panel, titled 'LOADED', contains the text 'No results.' The middle panel contains the instruction 'Upload a CSV file to get started. Then click a title to see the abstract and DOI.' The right panel, titled 'SELECTED', features a 'Download (.csv)' button and a list of eight article titles, each with a 'Remove' button. The titles are: 'Towards sustainable drone-based field surveying: a...', 'Design and validation of a drone-based field surveyin...', 'A novel approach to machine learning yield prediction...', 'Evaluating machine learning yield prediction performan...', 'Evaluating precision irrigation performance und...', 'Field deployment of a machine learning yield...', 'Evaluating precision irrigation performance und...', and 'Towards sustainable greenhouse climate contro...'. A black notification box at the bottom center of the main area displays the text 'Added to useful.'

13 Selected articles panel

The right-hand panel lists every article marked "useful" so far and lets you export just that curated subset as a new CSV file.

14 Exporting the curated selection

"Download (.csv)" exports only the articles marked useful, preserving the original Scopus columns -- ready to import into a reference manager or a systematic-review tool.
